

Homework 1 Report

I used Brackets as my text editor to do homework 1. At first I tried using Notepad++, but I found that I liked Brackets more because of the auto-update and other things as well. I only tested my code on Google Chrome. I don't really use other internet browsers and I did not try to test it on the other ones. While typing up my webpage I used w3 schools a lot to check certain tags and how to use them. I thought that the website was a very big help. I also looked at the example of homework 1 that was posted in the pdf for homework 2 as inspiration for how my website should look. I wanted to make sure that my CSS was not too horrible because I didn't use any frameworks.

One of the things that took me the longest was picking a topic, but not including that I think putting the table and the pictures in certain positions took me some time. Also, Brackets did not seem to be spacing or tabbing things properly, so when I was done I had to go back and make sure everything was aligned. I am not sure if I did this correctly, but it did not take too much time. This was also my first website and the assignment was fun.
